Understanding the SOAP Note Format

The SOAP note is a standardized method of documentation used by healthcare professionals to record patient encounters systematically. SOAP stands for Subjective, Objective, Assessment, and Plan. Each section serves a distinct purpose in organizing clinical information.

Subjective

The subjective section captures the patient's reported symptoms, concerns, and relevant medical history. This includes any breast-related complaints such as pain, lumps, nipple discharge, or changes noticed by the patient.

Objective

The objective section documents the clinician's physical examination findings and any diagnostic test results. For a breast exam, this includes inspection and palpation findings, symmetry, skin changes, and lymph node assessment.

Assessment

The assessment provides a clinical impression based on the subjective and objective data. In the case of a normal breast exam, this typically indicates no abnormalities detected and no signs suggestive of pathology.

Plan

The plan outlines the next steps in patient care, including education, screening recommendations, and follow-up instructions if needed.

Components of a Normal Breast Exam

A normal breast exam involves a comprehensive evaluation of both breasts, the surrounding tissues, and regional lymph nodes. The components include visual inspection and manual palpation under standardized technique.

Inspection

Inspection involves observing the breasts for size, shape, symmetry, skin texture, color changes, nipple appearance, and any visible masses or deformities. Normal findings show symmetrical breasts without skin abnormalities, retractions, or nipple inversion.

Palpation

Palpation is performed systematically in all quadrants of each breast and the axillary and supraclavicular areas to assess for lumps, tenderness, or irregularities. A normal exam reveals no palpable masses or lymphadenopathy.

Common Normal Findings

- Symmetrical breast size and contour
- Skin intact without erythema, dimpling, or edema

- Non-tender breast tissue
- No palpable lumps or nodules
- Normal nipple appearance without discharge or inversion
- No axillary or supraclavicular lymphadenopathy

Documenting the Subjective Findings

The subjective portion of a normal breast exam soap note usually reflects the absence of symptoms or concerns. It is important to document the patient's history accurately to provide context for the physical exam findings.

History of Present Illness

Include statements such as "The patient denies breast pain, lumps, nipple discharge, or skin changes." This clarifies the reason for examination and confirms the lack of reported breast symptoms.

Relevant Medical History

Document any personal or family history of breast disease, previous breast biopsies, surgeries, or cancer screening results. Even if the exam is normal, this information guides clinical decision-making.

Recording Objective Exam Results

Objective documentation is the core of the normal breast exam soap note, detailing findings from inspection and palpation. Precise language and standardized terminology improve clarity and facilitate communication among providers.

Inspection Findings

Note the absence of visible abnormalities with statements like "Breasts are symmetrical without skin changes, nipple retraction, or discharge."

Palpation Findings

Describe the palpation results, for example: "No masses, tenderness, or

thickening palpated in any breast quadrant. Axillary and supraclavicular nodes are not enlarged.”

Use of Descriptive Terms

- “Soft, non-tender breast tissue”
- “No palpable nodules or lumps”
- “Skin smooth and free of edema or dimpling”
- “Nipples normal in appearance without discharge”

Assessment and Impression in a Normal Breast Exam

The assessment summarizes the clinical impression based on the combined subjective and objective data. For a normal breast exam, the assessment confirms no signs of breast pathology.

Typical Assessment Statements

Common phrasing includes “Normal breast examination with no palpable masses or skin abnormalities” or “Breast exam unremarkable, no clinical evidence of malignancy.”

Clinical Significance

A documented normal breast exam provides reassurance to the patient and establishes a baseline for future comparisons. It also supports the clinician’s recommendation for routine screening and surveillance.

Plan and Follow-up Recommendations

The plan section outlines any further actions, patient education, and screening guidance relevant to breast health maintenance.

Screening Guidelines

Depending on age and risk factors, the plan may include routine mammography

scheduling or continued breast self-awareness education.

Patient Education

Include counseling on breast self-examination techniques, awareness of symptoms that should prompt re-evaluation, and lifestyle factors that impact breast health.

Follow-Up Instructions

For a normal exam, follow-up might consist of routine annual exams unless new symptoms arise. Documentation should reflect this clearly.

Sample Normal Breast Exam SOAP Note

Below is an example illustrating how to document a normal breast exam within the SOAP framework.

1. **Subjective:** Patient denies breast pain, lumps, nipple discharge, or skin changes. No personal or family history of breast cancer.
2. **Objective:** Breasts symmetrical without visible skin changes, nipple retraction, or discharge. Palpation reveals no masses, tenderness, or lymphadenopathy in axillary and supraclavicular regions.
3. **Assessment:** Normal breast examination. No clinical evidence of breast pathology.
4. **Plan:** Continue routine breast self-awareness and annual clinical breast exams. Advise mammography per age-appropriate guidelines.

Frequently Asked Questions

What is a normal finding in a breast exam SOAP note?

A normal breast exam SOAP note typically documents that both breasts are symmetric, without lumps, masses, or skin changes, nipple discharge, or tenderness.

How is the subjective section documented in a normal breast exam SOAP note?

The subjective section includes the patient's report of no breast pain, lumps, nipple discharge, or changes in breast size or shape.

What should be included in the objective section of a normal breast exam SOAP note?

The objective section should detail the clinician's findings such as breasts being symmetrical, no palpable masses, no skin dimpling or retraction, and no axillary lymphadenopathy.

How do you document the assessment in a normal breast exam SOAP note?

The assessment generally states that the breast exam is normal with no clinical findings suggestive of pathology.

What is an example of a normal breast exam note in the plan section?

The plan may include routine breast self-exam education, continuation of regular screenings as per guidelines, and to report any future changes promptly.

Why is it important to document a normal breast exam in a SOAP note?

Documenting a normal breast exam establishes a baseline, helps track changes over time, and provides medico-legal evidence of the clinical evaluation.

Can a normal breast exam SOAP note include findings from both inspection and palpation?

Yes, a comprehensive normal breast exam SOAP note includes inspection findings such as skin and nipple condition, and palpation findings confirming absence of lumps or tenderness.
